Tuberculosis is an opportunistic infection, mainly associated with impaired cellular immunity. It is rarely reported in association with joint diseases. A 40-year-old woman presented with pain, swelling and fever of the right knee and right ankle. Physical examination showed painful joint movements with swelling of the right ankle. Blood cultures were positive for Mycobacterium tuberculosis. Synovial fluid showed a purulent exudate. Magnetic resonance imaging (MRI) and contrast arthrography revealed an effusion with synovial thickening and irregular capsular enhancement. Open synovectomy and synovectomy were performed. Histological examination showed granulomas and Mycobacterium tuberculosis. The patient started a 6-month treatment with combination of isoniazid, rifampicin, and pyrazinamide. The diagnosis of septic arthritis was established and the patient recovered uneventfully. The review of the literature revealed 27 previously published case reports.Q: Using boost multi_index with priority queue I am using boost multi_index for my project. I want my priority queue to be sorted by using boost::multi_index (Please see below the sample priority queue): class PriorityQueue { struct Container { string name; int data; }; typedef boost::multi_index_container, boost::multi_index::identity > > > 82138339de
